

WHY GOUT PATIENTS NEED Balanced Pain Management

Roughly 30% of patients who go to the emergency room for a gout attack are prescribed opioids for their pain.¹

But opioids can introduce unnecessary risks, including:

MISUSE

ADDICTION

OVERDOSE²

Balanced pain management allows for **personalized, integrative treatment for gout flares** that might include:

- ▶ Colchicine
- ▶ Nonsteroidal anti-inflammatory drugs
- ▶ Cold compresses
- ▶ Corticosteroids

Patients can also avoid painful gout attacks by managing their disease with **uric-acid lowering medicine**.
